Sercel Equips 3D Mega-Crew Seismic Survey in North Africa

Sercel is pleased to announce that its high-performance equipment is currently being deployed on another 3D mega-crew survey, this time by a major North African geophysical company. The crew is operating with an 80,000-channel 508^{XT} land acquisition system, complete with QuietSeis[®] digital sensors, and ten Nomad 90 Neo broadband vibrators in challenging desert terrain.

Seamlessly integrated into the digital version of the 508^{XT}, QuietSeis, the industry's most advanced third-generation MEMS sensor, ensures optimum data accuracy and stability. With its outstanding low-noise performance, it detects the weakest signals in a very large frequency bandwidth. It also simplifies infield deployment, requiring less crew intervention and reducing inherent operational safety risks.

Combined with the superior seismic data performance of QuietSeis, super-heavy Nomad 90 Neo vibrators are the ideal choice for a high-productivity broadband survey program, providing a wider frequency range, high energy output and excellent sweep quality.

Emmanuelle Dubu, Sercel CEO, said: "It is especially exciting to have our latest-generation digital equipment deployed on this high-channel-count onshore survey. Our 508^{XT} acquisition system and Nomad 90 Neo vibrators are exactly the right combination for high-performance surveys, delivering unparalleled subsurface data quality for clearer seismic imaging."

About Sercel

Sercel designs and manufactures high-tech solutions for subsurface exploration. Capitalizing on its world-leading position in the seismic acquisition industry, Sercel also provides innovative solutions for structural monitoring, defense and underwater acoustics applications. Headquartered in Nantes (France), Sercel operates worldwide and employs more than 1,500 people. More information about Sercel is available at www.sercel.com.
